

TEAM PROJECT

In this course, you will work together in teams of two or three to complete a scientific project in the field of Materials Science. Several topics are available for selection. The goal of this project is to explore a specific topic in depth, conduct a literature review, and finally present and discuss your findings. There are several subjects you can choose:

- **What is a BCC–Superalloy?**
- **Stacking Faults in GaN**
- **Impurity Doping Versus Polarization Doping in Nitride Materials**
- **Heat Treatment and Modeling for Precipitation–Hardenable Aluminum Alloys**
- **Material Modelling of Shape Memory Alloys (SMAs) and their Fatigue Behaviour**

Your tasks:

- **Form small groups** of 2–3 students.
- **Choose one topic** from the list of offered project themes.
- **Work on the defined tasks** described in the project description.
- **Write a paper** (three to six pages, include pictures, schemes etc. that helps to understand the subject) that
 - introduces your chosen topic,
 - explains the motivation behind it, and
 - briefly describes the scope of your work.
 - contains the presentation and discussion of the results
- **Prepare a presentation** that
 - introduces the topic,
 - presents your workflow and documentation,
 - summarizes your outcomes,
 - gives an outlook on possible future work.

The presentation should include approximately 20 slides (more or less).

At the end of the project, each group will present their results and discuss their findings with the class.

If there are any questions occurring, you may contact the supervisors of your task.

Deadline Paper: 23rd March 2026

Presentations: 30th March 2026
